STEP-DIODE/5-24DC/2X5/1X10

Redundancy module

Data sheet 104970 en 00

© PHOENIX CONTACT 2014-12-17

1 Description

Using the redundancy module, it is possible for two power supply units of the same type that are connected in parallel on the output side to increase performance or for redundancy to be isolated from one another.

The reliability of a power supply determines the availability of individual components in a system and whether complex systems can function safely.

Redundant circuits are intended to supply systems that set high demands on operational reliability. Long-term, permanent system availability is ensured by the redundant setup of the power supply.

The power supply of a system can be configured redundantly by switching at least two power supply units in parallel. Together, they then supply the connected devices.

The power supply units involved must be dimensioned to enable the total current requirements of all loads to be covered by one single power supply unit. In the event of an internal device fault or failure of the mains power supply on the primary side, the other device automatically takes over the entire power supply of the loads without interruption.

This means that operational reliability of the entire system can be effectively increased.

Features

- Decoupling power supply units switched in parallel
- Load currents up to 10 A are possible
- Easy mounting by snapping onto the DIN rail or screwing onto the mounting surface

Make sure you always use the latest documentation.

It can be downloaded from the product at phoenixcontact.net/products.

5 Intended use

This redundancy module features IP20 protection and is intended for installation in housing. It is suitable for use in industrial applications.

The technical specifications must be taken into consideration and observed.

6 Structure

6.1 Device elements

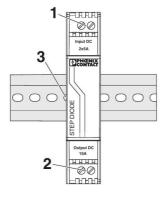

Figure 1 Device elements

- 1. DC input: Screw terminal blocks above
- 2. DC output: screw terminal blocks below
- Universal snap-on foot: 35 mm DIN rail according to EN 60715

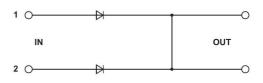

Figure 2 Block diagram

Element	Meaning
\forall	Decoupling

7 Assembly

7.1 Unpacking

Before mounting the redundancy module, it must be checked for damage:

- Take the device out of its packaging.
- Check the device for any damage sustained during transport.
- Retain the package slip for future use.
- Dispose of packaging in an environmentally-friendly way.

7.2 Mounting the redundancy module

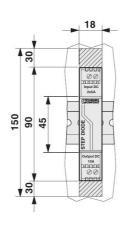

The redundancy module is intended for installation in a distributor box or control cabinet.

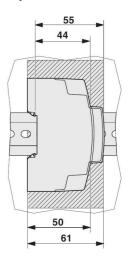

The redundancy module is designed for convection cooling. A minimum distance from other devices must be maintained in order to ensure convection cooling.

Prior to mounting the redundancy module:

 The minimum distance from other devices that must be observed in order to ensure convection cooling is: 30 mm vertically, 0 mm horizontally

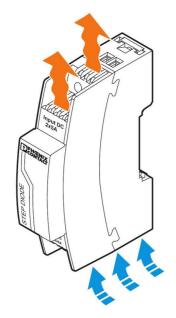

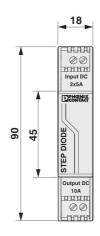

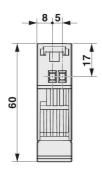

Figure 3 Convection

- The device dimensions

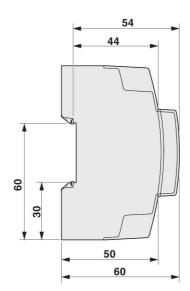

Figure 4 Device dimensions

7.3 Mounting on a DIN rail

The redundancy module can be installed on all 35 mm DIN rails according to EN 60175.

Snap the redundancy module directly onto the DIN rail.

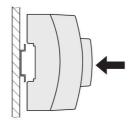

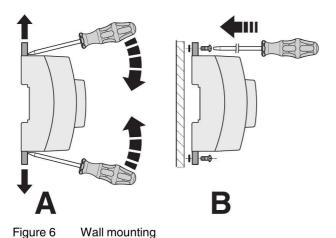

Figure 5 Mounting on a DIN rail

7.4 Wall mounting

If the redundancy module is to be fixed directly onto an even surface, press the orange base latch upward and down. Place a washer between the pulled out base latch and the even surface (maximum outside diameter of 8.5 m, maximum thickness of 1.3 mm, e.g., spring washer for M4 according to DIN 127-B or toothed lock washer according to DIN 6797).

Then secure the device with two screws (maximum thread diameter of 4 mm, maximum head diameter of 8.5 mm).

7.5 Normal mounting position

When installed, the input terminal blocks must be at the top and the output terminal blocks at the bottom.

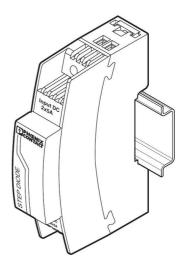

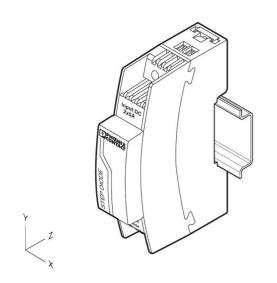

Figure 7 Normal mounting position

7.6 Behavior in the case of alternative mounting positions

For mounting positions that differ from the normal mounting position, the output power must be reduced (position-dependent derating).

The characteristic curve can be used to determine the maximal output power to be drawn for each ambient temperature for different mounting positions.

Normal mounting position

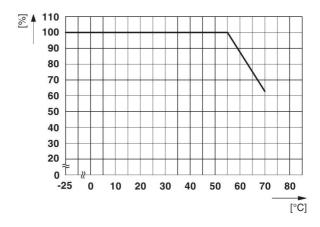

Figure 8 Normal mounting position

8 Install the redundancy module

8.1 Safety regulations and installation notes

EXPLOSION HAZARD!

Only remove equipment when it is disconnected and not in the potentially explosive area.

DANGER

Never carry out work when the power is turned on.

CAUTION:

Before startup please ensure:

The connection must be carried out by a competent person and protection against electric shock guaranteed.

All feed lines are sufficiently protected and dimensioned!

All output lines are dimensioned according to the maximum output current of the device or separately protected!

Sufficient convection must be guaranteed.

Observe mechanical and thermal limits.

The redundancy module is maintenance-free. Repairs may only be carried out by the manufacturer.

NOTE: Danger if used improperly

The redundancy module is a device installing into an enclosed space. Installation and start-up may only be carried out by qualified personnel. The relevant country-specific regulations must be observed.

8.2 Device connections

Screw connection for input DC

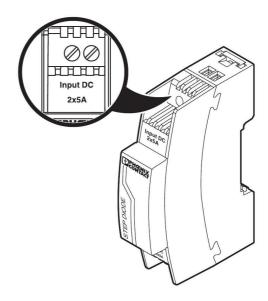

Figure 14 Screw connection for input DC

Screw connection for output DC

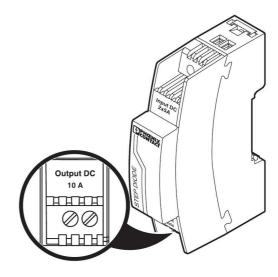

Figure 15 Screw connection for output DC

8.3 Connecting cables

Use two cables of the same length and the same cross section to connect the redundancy module to the power supply.

Use copper cables with an operating temperature > 75°C (ambient temperature < 55°C) and > 90°C (ambient temperature < 75°C).

Use ferrules for flexible cables.

Input

To decouple two parallel connected power supplies 1 and 2 with nominal currents of up to 5 A, one redundancy module is needed.

 Connect one input of the redundancy module to one power supply in each case.

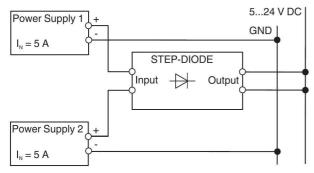

Figure 16 Decouple power supplies with nominal currents \leq 5 A

One redundancy module per power supply is required to decouple power supplies with nominal currents from 5 A to 10 A.

1. For this purpose, connect the two inputs of one redundancy module to one power supply in each case.

This is necessary because the maximum current carrying capacity of 5 A per input must not be exceeded.

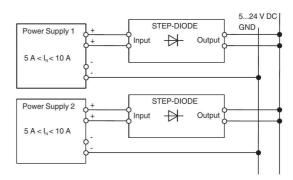

Figure 17 Decouple power supplies with nominal currents from 5 A to 10 A

Output

 Wire the load with the plus terminals to the output of the redundancy module.

Close all unused clamping spaces.

9 Redundancy module in operation

\triangle

WARNING: Risk of burns

Depending on the ambient temperature and the load, the housing can become very hot.

The redundancy module is maintenance-free. Repairs may only be carried out by the manufacturer.

The warranty no longer applies if the housing is opened.

9.1 Temperature-dependent derating

In the horizontal mounting position, the redundancy module can carry permanent load currents up to a maximum of $2 \times 5 \text{ A}$ or $1 \times 10 \text{ A}$ at ambient temperatures of up to 55°C . Depending on the ambient temperature, the permissible current carrying capacity is reduced in the case of a conductor cross section of 2.5 mm^2 .

A maximum of 2 x 3.5 A or 1 x 7 A can be permanently carried at an ambient temperature of 70°C.

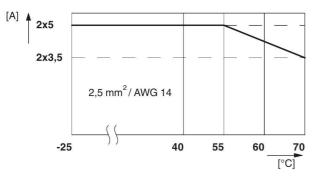

Figure 18 Temperature-dependent derating

10 Removal

10.1 Uninstall the redundancy module

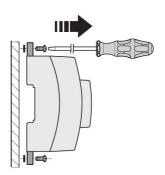

Figure 19 Removal

10.2 Notes on disposal

Do not dispose of the redundancy module with household waste. It should be disposed of in accordance with the currently applicable national regulations.

104970_en_00
